Polynucleotide encoding peptidoglycan recognition protein-like protein, antibodies specific to it useful for preventing, treating conditions e.g. endotoxic shock and auto-immune disorders and infections in mammal

Claim 11; Fig 3; 191pp; English

Novel human peptidoglycan recognition protein-like proteins (PGRP) expressed by keratinocytes (PGRP-K), wound healing tissues (PGRP-W) or chondrosarcoma tissue (PGRP-C) are disclosed. The PGRP DNA and proteins are useful for preventing, treating or ameliorating a medical condition in a mammal (claimed). PGRP is useful in augmenting the immune immune system activation. Antibodies or antagonists directed against these proteins may be useful in reducing or eliminating disorders associated with tumour necrosis factor (PWF) and TMF-like cytokines, such as endotoxic shock and autoimmune disorders and for treating condition in a mammal (claimed). PGRP is useful in augmenting the imsystem in such areas as immune recognition, antigen presentation and Novel human peptidoglycan recognition fibrosis including silicosis, sarcoidosis and idiopathic

                                                                                                                                                                                                                                                                                                   AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          17-NOV-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Secreted and transmembrane useful as hybridization pro

                                                                                                                                                                                                                              Escherichia coli, Candida albicans, Salmonella typhimurium and C. neoformans (claimed). They can be used in human or veterinary medicine (particularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post-harvest spoilage or expressed in transgenic plants to increase their disease resistance. They have low immunogenicity. Carboxamidated analogues of BGP-A and MGP-A may also be used.
                                                                                                                                                                                                                                                                                                                                                     This protein comprises the precursor (see AAW23722) of a novel, claimed antimicrobial peptide from bovine neutrophils, designated bovine granulocyte peptide A or BGP-A (see AAW23724). Its amino aci sequence was deduced from a cDNA clone (see AAT9509) obtained from bovine bone marrow. BGP-A and the murine homologue, MGP-A (see AAW23725), exhibit activity against Gram-positive and Gram-negative bacteria, fungi and viruses, specifically Staphylococcus aureus,
                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antimicrobial (poly)peptide(s) from bovine and murine granulocytes useful therapeutically, as preservatives for food, in water treatment and in agriculture

                                                                                                                                                                                                                                                             This sequence is the murine tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or terratocarcinoma), sarcoma (Kaposi's, osteo- or fibro-sarcomas), melanoma or leukaemia, and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 polypeptide inhibits tumour growth are serviced mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as resgents for detecting tag7; as an antagonist of tag7; for isolating tag7 and therapeutically to inhibit or delay tumour metagraters.

                                                                                   Escherichia coli, Candida albicans, Salmonella typhimurium and C. neoformans (claimed). They can be used in human or veterinary medicine (particularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post harvest spoilage or expressed in transgenic plants to increase their disease resistance. They have low immunogenicity. Carboxamidated analogues of MGP-A and BGP-A may also be used.
                                                                                                                                                                                                                   This protein comprises the precursor of a novel, claimed antimicrobial peptide from murine neutrophils, designated murine granulocyte peptide A or MGP-A (see AAM23725). Its amino acid sequence was deduced from a cDNA clone (see AAT9510) obtained from murine bone marrow. MGP-A and the bovine homologue, BGP-A (see AAW23724), exhibit activity against Gram-positive and Gram-negative bacteria, fungi and viruses, specifically Staphylococcus aureus,
                                                                                                                                                                                                                                                                                                                                                                     Antimicrobial (poly)peptide(s) from bovine and murine granulocytes useful therapeutically, as preservatives for food, in water treatment and in agriculture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antimicrobial peptide; antibiotic; antibacterial; antifungal; fungicide; antiprotozoa; protozoacide; antiviral; virucide; murine granulocyte peptide A; MGP-A; preservative; sepsis;

Sequences, corresponding to human secreted proteins. AAY64651 to CAX65438 represent the EST-related proteins corresponding to AAZ42265 to AAZ43052. The 5' ESTs can be used for producing secreted human gene C products. They can be used to identify and isolate 5' untranslated c regions (UTRs) and upstream regulatory regions which control the C location, development stage, rate, and quantity of protein synthesis, as c well as stability of mRNA. The ESTs are also useful as probes for C chromosome mapping, and to obtain full length cDNA clones. The ESTs can CC diagnostic procedures to identify individuals, or in CC diagnostic procedures to identify individuals having genetic diseases C resulting from abnormal gene expression. The products may also be used in CC gene therapy protocols. The nucleic acids encoding signal peptides can be CC used for directing extracellular secretion of a polypeptide or the CC into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventuaseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

      The invention relates to an isolated polypeptide comprising a 277, 480 583, 581, 628, 424, 638, 229, 310, 841, 241, 369, 382, 185, 586, 1026, 844, 782, 262, 394, 471, 485, 286, 533, 495, 350, 619, 490, 462, 255, 784, 252, 593, 472, 607, 781, 640, 686 or 154 amino acid sequence as given in the specification. The polypeptides, modulators of the polypeptides and antibodies against the polypeptides are useful for treating diseases such as neurological and psychiatric diseases. Including Alzheimer's, parasupranuclear palsy, Huntington's disease, myotonic dystrophy, anorexia and depression; cardiovascular diseases including congestive heart failure, Hodykin's disease and myocardial pulmonary disease, cystic fibrosis and adult respiratory distress enhancements of the service constructive surfarements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27-APR-2000; 2

The present sequence is human full length granulocyte peptide (GP-A) CC homolog, Zgpal protein. Zgpal gene is located on human chromosome 1. CC zgpal polypeptides are useful for producing antibodies which are useful CC for detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating dental carries, periodontal disease, thrush, CC detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating dental carries, periodontal disease, thrush, CC questrointestinal disease, urinary tract infections, vaginal infections, caquired immune deficiency syndrome (AIDS) and CC useful for treating dental threat in the fusion CC proteins associated with cystic fibrosis and prevention of CC infection in skin and other epithelial wounds. Zgpal-cytokine fusion CC proteins are useful for enhancing in vivo killing of target tissues (epithelial cancers, and more specifically lung, ovarian and rectal CC cancers). Zgpal polypeptides, fragments, fusion proteins or agonists are useful in in vitro studies of exogenous microorganism infections such as bacterial, viral or fungal infection and also to study epithelial cell cell cells of cancers. Zgpal sequences are useful so diagnostics in RNA or CC ansers. Zgpal sequences are useful as diagnostics in necl cancers. Zgpal sequences are useful as diagnostics in neclic manual cancers are useful as diagnostics in cells. Squal antibodies are useful as diagnostics in neclic and as probes or primers to clone 5 non-coding cells regions of a zgpal gene. Zgpal antibodies are useful for tagging cells
                                                                                                                                                                                                                                                                                                                                                                                     Claim 14; Page 109-110; 114pp; English.

The present sequence is human full length granulocyte peptide (GP-A) homolog, Zgpal protein. Zgpal gene is located on human chromosome 1. Zgpal polypeptides are useful for producing antibodies which are useful for detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating dental carries, periodontal disease, thrush, detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating dental carries, periodontal disease, thrush, detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, uninary tract infections, vaginal infections,
polypeptides are useful for detection of zgpal polypeptide, mRNA or anti-zgpal antibodies, thus serving as markers for detecting genetic diseases or cancers. Zgpal sequences are useful as diagnostics in forensic DNA profiling and as probes or primers to clone 5 non-coding regions of a zgpal gene. Zgpal antibodies are useful for tagging cells that express zgpal, for screening expression libraries and as neutralizing antibodies or as antagonists to block zgpal activity in vitro and in vivo. Zgpal gene is also useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                            proteins are useful for enhancing in vivo killing of target tissues (epithelial cancers, and more specifically lung, ovarian and rectal cancers). Zgpal polypeptides, fragments, fusion proteins or agonists are useful in in vitro studies of exogenous microorganism infections such as bacterial, viral or fungal infection and also to study epithelial cell defensing induction in cell culture. Zgpal antibodies, polynuclectides and content of the content of the culture of the content of the culture of the content of the culture of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New granulocyte peptide homolog, zgpal polypeptide, for research applications, diagnosis and treatment of cancer, periodontal, gastrointestinal disease, urinary tract, skin and lung infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20-OCT-1999; 99US-0160712.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an antibody that binds to a human CC protein (I) selected from: pro381; pro1269; pro1410; pro1755; pro1780; CC pro4344; pro1927; pro15567; pro1295; pro1293; pro4334; pro4354; pro4359; pro1555; pro1096; pro2038; and pro2262. (I) has CC anticancer activity and can be used to diagnose tumours in mammals, by CC detecting complex formation when the antibody is contacted with test CC cells. Increased expression of genes encoding (I) can also be detected CC diagnose tumours. Agents which inhibit the activity of (I), can be used to diagnose tumours growth, CC especially the antibodies, or an antisense oligonucleotide which CC preferably by inducing cell death. Methods from the present invention CC can be used to identify compounds which inhibit the biological activity CC of (I). AAC58019 to AAC58102 represent invention for human PRO CC sequences. AAC58103 to AAC5812 and AAB24021 to AAR24404 prepresent human PRO CC probes used in examples from the present invention for human PRO CC promotes and protein sequences given in the examplification of CC the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              08-MAR-1999;

                                                                                                                          AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA3730 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   17-NOV-1998;

CC nucleotide sequences encoding them. The polynucleotide sequences given in AAA80606-A80623 encode the 12 secreted protein sequences given in CC AAB25576-B2559. The human secreted proteins have various activities of the proteins in which they are expressed. Examples of the CC antivities of the proteins include: immunosuppressant; CC antivities antibacterial; antiarteriosclerotic; anticancer; vulnerary; CC antivital; antibacterial; and antifungal activity. The proteins, CC antivital; antibacterial; and antifungal activity. The proteins, CC and/or diagnose various disease, disorders and conditions examples of arthritis, dermatitis, and multiple sclerosis; inflammatory disorders e.g. Addison's disease, rheumatoid CC e.g. inflammatory bowel disease, Crohn's disease and nephritis; CC ardiovascular disorders e.g. coronary arteriosclerosis and protein genes infectious diseases. The human secreted protein gene #8 and protein genes are represented in sequences AAA80613 and AAB25583. Sequences xx AAA80662-A80663 represent genes related to the secreted protein gene#8. The present invention relates to 12 secreted human proteins and to nucleotide sequences encoding them. The polynucleotide sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel human peptidoglycan recognition protein-like proteins (PGRP) expressed by keratinocytes (PGRP-K), wound healing tissues (PGRP-W) or chondrosarcoma tissue (PGRP-K), wound healing tissues (PGRP-W) or chondrosarcoma tissue (PGRP-K) are disclosed. The PGRP DNA and proteins are useful for preventing, treating or ameliorating a medical condition in a mammal (claimed). PGRP is useful in augmenting the immune system in such areas as immune recognition, antipen presentation and immune system activation. Antibodies or antagonists directed against these proteins may be useful in-reducing or eliminating disorders associated with tumour necrosis factor (TMF) and TMF-like Cytokines, such as endotoxic shock and autoimmune disorders and for treating infectious diseases including silicosis, sarcoidosis and idiopathic contents of the protein such as the contents of the contents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mat_peptide

Cells containing the tag? DNA sequence are used to express recombinant tag? Tag? is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo- or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag? polypeptide inhibits tumour growth and induces appotosis. The tag? polypeptide inhibits tumour growth and sprobes for gene mapping and detection of tag? gene expression, and as primers. Antibodies against tag? are used as reagents for detecting tag?; as an antagonist of tag?; for isolating tag? and therapeutically to inhibit or delay tumour materartaries.

                                                                                                                                20
                                                                                                                                                                                                                                                                                                                           The present invention describes an antibody that binds to a human CD protein (I) selected from: PRO381; PRO1269; PRO1410; PRO1755; PRO1780; PRO4344; PRO1927; PRO1557; PRO1293; PRO1303; PRO1303; PRO4344; PRO4354; PRO4397; PRO4407; PRO1555; PRO1096; PRO2038; and PRO2262 (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                   Query Match

                                                                                                                                                                                            AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO porteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA3730 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                            New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                  Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Baker

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      homologue, MGP-A (see AMW33725), exhibit activity against Gram-positive and Gram-negative bacteria, fungi and viruses, specifically Staphylococcus aureus, Escherichia coli, Candida albicans, Salmonella typhimurium and C. neoformans (claimed). They can be used in human or veterinary medicine (particularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post-harvest spoilage or expressed in transgenic plants to increase their disease resistance. They have low immunogenicity.

                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                      sequences, corresponding to human secreted proteins. AALONG AAX65438 represent the EST-related proteins corresponding to AALA2265 to AAX43052. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the
                                                                                                                                                                                                               Sequence 380 BP; 67 A; 130 C; 114 G;
                                                                                                                                                                                                                                                        insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. AAZ42249 to AAZ42264 and AAX64644 to AAX64650 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                     This sequence encodes the murine tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo- or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7; as an antagonist of tag7; for isolating tag7 and therapeutically to inhibit or delay tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tag7;
